

All-on Four A new era of digital dentistry

Many patients today, who are faced with failing teeth or non-treatable periodontal disease, do not want a denture that their parents or grandparents had. Today's patients are looking for a modern method to predictable tooth replacement, with gaining or maintaining the function and expectations of real natural teeth. Now, modern dentistry has a solution - The All on Four Procedure, as a lasting and effective alternative modern form of tooth replacement. Many times with dentures, patients must compromise their function, have eating limitations, and wear adhesive. With a prosthesis that is screwed in or permanent- patients no longer have to live with limitations. Today's hi-tech implant systems enable a minimum number of implants to support maximum number of teeth. This means that few as four implants can be used to support a full arch (upper or lower jaw) of fixed, non-removable replacement teeth. This remarkable life-changing event can be accomplished in a single day
