

Oral Manifestations in Renal Transplant Patients

Chronic renal failure has become a national health problem in Egypt in the last several decades. The modern strategy of treating this condition is by renal transplantation. Mansoura Urology center is the largest one in the Middle East that performs much renal transplant operation annually.

Immunosuppressive drugs are used to prevent the organ rejection; unfortunately they exert, not only a strong immune-suppression, but also associated with many oral diseases and many complications. Hence, dentists will be called to deal with these complications.

The aim of this work is to shed light on the oral manifestations that occurred in renal transplant patients and how dentists can deal with them in a trial to prevent, or at least, decrease the opportunity of their occurrence.
